           <br>
           <strong>Project Description:</strong><br>
```

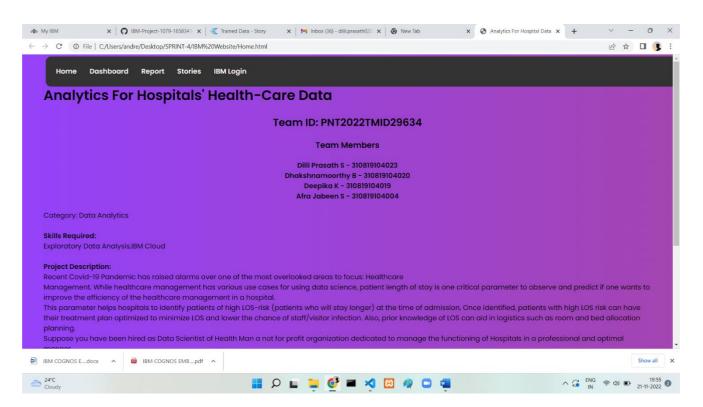

```
Recent Covid-19 Pandemic has raised alarms over one of the most overlooked
areas to focus: Healthcare <br>>
Management. While healthcare management has various use cases for using data science,
patient length of stay is one critical parameter to observe and predict if one wants to
improve the efficiency of the healthcare management in a hospital.<br>
This parameter helps hospitals to identify patients of high LOS-risk (patients who will
stay longer) at the time of admission. Once identified, patients with high LOS risk can
have their treatment plan optimized to minimize LOS and lower the chance of
staff/visitor infection. Also, prior knowledge of LOS can aid in logistics such as room
and bed allocation planning.<br>
Suppose you have been hired as Data Scientist of Health Man a not for profit
organization dedicated to manage the functioning of Hospitals in a professional and
optimal manner.<br><br>>
<strong>Goal:</strong><br>
The goal is to accurately predict the Length of Stay for each patient on case by case
basis so that the Hospitals can use this information for optimal resource allocation
and better functioning. The length of stay is divided into 11 different classes ranging
from 0-10 days to more than 100 days.<br><br>>
<strong>Technical Architecture:</strong><br><br>
